# Abstract

Urban communities often face recurring civic problems such as potholes, damaged streetlights, and unmanaged waste. Despite being frequently observed by citizens, these issues often remain unresolved due to fragmented reporting channels and lack of accountability. To address this gap, we propose a **Crowdsourced Civic Issue Reporting and Resolution System** — a mobile-first, web-enabled platform designed to empower citizens, streamline communication, and enhance municipal responsiveness.

Through this platform, users can capture real-time images of civic issues (with automatic geotagging and Aadhaar-based authentication for genuineness), submit them as complaints, and choose whether to make them public or private. Other users can upvote complaints to highlight their priority. The system integrates three dashboards:

- **User Dashboard**: Profile management, location-based complaints, upvotes, complaint tracking with color-coded statuses (Pending/Red, In Progress/Yellow, Resolved/Green), and structured communication with authorities.
- **Authority Dashboard**: Department-specific complaint list, step-wise resolution tracking, communication with users and admins, and statistics on performance.
- **Admin Dashboard**: Central oversight of all complaints, setting resolution timelines, issuing reminders, escalating unresolved issues, and monitoring overall system performance..

This solution ensures **transparency, accountability, and engagement** by bridging the gap between citizens and local governance, fostering a collaborative ecosystem for smarter cities and more responsive municipal services.
